13

We claim:

- A polyamide which contains a monoolefinically unsaturated
 monocarboxylic acid of the formula CH₂ = CH-(CH₂)₃-COOH chemically bonded at the end of the polymer chain via an amide group.
- 2. A polyamide as claimed in claim 1, where the content of the monoolefinically unsaturated monocarboxylic acid of the formula CH₂ = CH-(CH₂)₃-COOH is in the range from 0.001 to 2 mol%, based on 1 mole of amide groups of the polyamide.
- 3. A polyamide obtainable by crosslinking a polyamide as claimed in claim 1.
- A process for preparing a polyamide, which comprises carrying out the reaction of monomers suitable for forming a polyamide to give a polyamide in the presence of a monoolefinically unsaturated monocarboxylic acid of the formula CH₂ = CH-(CH₂)₃-COOH.
- A process for preparing a polyamide, which comprises carrying out the reaction of oligomers suitable for forming a polyamide to give a polyamide in the presence of a monoolefinically unsaturated monocarboxylic acid of the formula CH₂ = CH-(CH₂)₃-COOH.
- 6. A fiber, a film, or a molding, comprising a polyamide as claimed in claim 1 or 2.
